

Feedback GA 1-8

General comments:

Multiple groups refer to figures, but do not include them in the report. Multiple groups just use two gaussian marginal distributions, which is not in the spirit of the GA, as they then simply used Bivariate Normal distribution, instead of using the Bivariate Class that uses the copula.

Q1: Multiple groups choose the marginal distribution, based upon **only** the skewness. Using only skewness to choose the appropriate marginal distribution is not correct, you should have used method of moment (skewness being the third moment). Some use the same distribution as the previous week without further discussion.

Q2: Confusion on whether to use the empirical value of $X_{90}(\text{percentile})$ or the value obtained from using *.pdf* on the fitted distributions. I both were accepted as valid solutions, except when they are used interchangeably in the same report.

Q3: The qualitative comparison was missing in several groups.

Q4: Multiple groups limit the analysis to only the effect of the correlation coefficient, without mentioning the possible effects of the marginal distributions
